

WAYS TO IMPROVE PLANTING STOCK OF WORK ON THE REPRODUCTION OF FORESTS IN RIVNE ENTERPRISES FORESTRY AND HUNTING ADMINISTRATION.

O.Yu. Kaydyk, M.Yu. Tymoshchuk

The modern state, problems and prospects of material well-being by the planting-stock of works on forests renewal of Rivne region are considered and measures on an improvement are resulted.

Studies have shown that Rivne Forestry and Hunting Administration has a well-established system of seedling that helps realize a number of objectives set national target program "Forests of Ukraine", and shows a good example for other businesses.

In general, improving availability of planting material works reproduction of forests in Ukraine should be introduced in place a set of important events, such as: agronomic, economic and technological.

To meet planting material works on restoration of forests need to expand the range of grown seedlings, primarily through bushes and trees pioneer species, such as: birch, linden, pear, euonymus, hazel, buckthorn, chokeberry Aronia and others. It is also recommended to expand the assortment of forest planting material by seedlings and seedlings with closed root system and introduce mikoryzovano growing plant material.

The main farming practices compliance is scientifically based crop rotation, irrigation system is perfect, regardless of region, rational fertilization system. A good project is the construction of complex seedling to be equipped with modern technology that will increase the number and improve the quality of cultivated plant material.

Reforestation, afforestation, forestry seedling, planting stock of forest, range, assortment, ecologically oriented forestry.
